

CubeX is a decentralized platform for deploying ERC20 tokens with zero upfront costs. No coding required!

When you deploy your token through CubeX, it's automatically paired with DAI for stability, CUBE for added liquidity, and a volume token of your choosing for volatility.

These three positions give your token liquidity and trading volume right from the start, with no need to provide your own assets to fund the pool.

How It Works:

=====

Launch Without Liquidity:

Since CubeX uses Uniswap V3, there's no need for initial liquidity. Your token will be instantly tradable as soon as you call the initialize function.

Stable + Volatile Pairings:

DAI provides stability for your token price, while your chosen volume token (like a high-volume coin) adds volatility, creating opportunities for bots to trade and balance prices between pairs. This increases trading activity and fees for Your CubeX.

CUBE as a Reserve:

Every token launched through CubeX is also paired with CUBE, which acts as a backing reserve currency, adding depth and liquidity to all CubeX tokens.

Your Role:

=====

You Own the Token:

You remain the owner of the token contract and can update information on third-party platforms like Etherscan, Dextools, etc.

Claim Trading Fees:

As the deployer, you can claim the trading fees accumulated in the liquidity pools. Anyone can call the claim function, but they'll only get 2%—the rest goes to you.

Given the competitive nature of MEV bots it's more than likely they will automate the claiming process if there's money in it for them. This means you will generate money quite literally on autopilot.

Steps to Create Your Token:

=====

1. Set your token's name and symbol.
2. Set the total supply - optional (default is 1b).
3. Choose a volume token - optional (default is WETH).
4. Deploy and initialize your token—no need for upfront liquidity.

Why Choose CubeX?

Zero initial liquidity required:

With the Uniswap V3 protocol your token becomes tradable (buyable) immediately after initialization.

Locked Liquidity:

Liquidity pools are permanently locked in the contract, ensuring your project is safe from rug pulls.

Generate Fees and Grow:

Your CubeX generates trading fees not only from people trading it, but also as MEV bots balance the pairs. MEV bots work 24/7 so if there's an imbalance, they will fix it- you accumulate trading fees every time this happens.

CubeX makes token creation simple, fast, and secure—all without spending a penny!

Currently supported chains:

Ethereum Mainnet, Arbitrum One, Base Mainnet
